D2 · The Receipt Reconciler

DOCUMENT TASK DIFFICULTY 5/10

A finance team reconciles employee receipts against the company-card statement every month, by hand.

Build

A tool that matches receipt photos to bank-statement lines and surfaces the problems.

Must handle

- Extract amount, date, and merchant from each receipt photo.
- Match receipts to statement lines (both directions).
- Flag duplicates, receipts with no matching line, statement lines with no receipt, and amount mismatches.
- Output a clear reconciliation report (matched / unmatched / flagged).

> **Data model** — Receipts, statement lines, and the *match* between them as its own entity — with a status and reason (matched / duplicate / missing / mismatch), not a boolean. Model the unmatched on both sides.

We'll give you

~20 receipt images and a one-month bank-statement CSV (~20 lines), with duplicates, missing receipts, and amount mismatches mixed in.

Out of scope

Accounting-software integration, multi-month, currency conversion unless present.

The bar for “good”

> It catches the planted discrepancies **without crying wolf** on the clean ones, and the report is clear.

> **Submit:** a **live link** we can open and use + a **4–6 min video** (demo it working and walk us through your data model). **No repo.**
